3.4.4	**Nomenclature and Isomerism in Organic Chemistry**	
	Naming organic compounds	be able to apply IUPAC rules for nomenclature not only to the simple organic compounds, limited to chains with up to 6 carbon atoms, met at AS, but also to benzene and the functional groups listed in this unit
	Isomerism	know and understand the meaning of the term *structural isomerism*
		know that E-Z isomerism and optical isomerism are forms of stereoisomerism
		know that an asymmetric carbon atom is chiral and gives rise to optical isomers which exist as non super-imposable mirror images and differ only in their effect on plane polarised light
		understand the meaning of the terms *enantiomer* and *racemate*

		understand why racemates are formed
		be able to draw the structural formulae and displayed formulae of isomers
		Appreciate that drug action may be determined by the stereochemistry of the molecule and that different optical isomers may have very different effects
