5.5	understand the role of decomposers in food chains and the recycling of materials	understand that: • bacteria and fungi are involved in the process of decay • breaking down dead animals and plant material releases nutrients back to the soil. *Year 6: Micro-organisms*

Topic 6: Plant life cycles

Students should:		Guidance *iPrimary Curriculum reference*
6.1	understand that some plants have flowers that produce seeds which grow into new plants	*Year 6: Plant life cycles*
6.2	know the life cycle of a typical flowering plant, using the terms *germination*, *flowering*, *pollination*, *fertilisation* and *seed dispersal*	*Year 6: Plant life cycles*
6.3	explain why seeds need to be dispersed	*Year 6: Plant life cycles*
6.4	understand the conditions required for the germination of seeds	water and temperature *Year 6: Plant life cycles*
6.5	know that pollination is the transfer of pollen from the anther to the stigma on the same or a different flower	*Year 6: Plant life cycles*
6.6	understand the processes of insect and wind pollination	a simple description only: • bright coloured and scented flowers attract insects • insects brush against anther/pollen • sticky stigma takes pollen off insect • large filaments hang anthers outside flower so pollen is blown by the wind • large stigmas catch pollen. *Year 6: Plant life cycles*
6.7	know the parts of an insect-pollinated flower	these parts include sepal, petals, stamen (filament and anther), carpel (stigma, style, ovary and ova) *Year 6: Plant life cycles*
6.8	explain the function of the parts of an insect pollinated flower	*Year 6: Plant life cycles*
6.9	understand the terms *pollination* and *fertilisation*	pollination, the transfer of pollen from the anther to the stigma fertilisation occurs when the nucleus from the pollen combines with the nucleus in an ovule – detailed mechanism **NOT** required *Year 6: Plant life cycles*
