15 Hypothesis testing, significance testing, confidence intervals and power (continued)

Subject content	Additional information
15.5 Interpret Type I and Type II errors, in hypothesis testing and know their practical meaning.	Students will be expected to know that: • a Type I error is when the null hypothesis is true but is rejected • a Type II error is when the null hypothesis is false but is accepted and that these should be interpreted in the given context. Students should understand the link between the significance level of a test and the probabilities of Type I and Type II errors for the test. Also, the impact on these errors of selecting a different significance level.
15.6 Calculate the risk of a Type II error.	Students are expected to know that the power of a test is given by Power = 1 – P(Type II error). Students will not be required to draw a power curve.
