19.1	Conduct a statistical goodness of fit test for binomial, Poisson, normal and exponential distributions or for a specified discrete distribution using $\sum \frac{(O-E)^2}{E}$ as an approximate χ^2 statistic.	Students will be expected to know how to find the number of degrees of freedom and that questions set will not require the use of Yates' correction. Students must follow the rule to combine classes when expected frequencies are smaller than 5, and 'pooling' is sensible.

20 Analysis of variance

Subject content	Additional information
20.1 Conduct one-way analysis of variance, using a completely randomised design with appreciation of the underlying model with additive effects and experimental errors distributed as $N(0, \sigma^2)$.	Students will only be required to use one-factor ANOVA or two-factor ANOVA (and will not be required to use a Latin square). (applies to all of section 20)
20.2 Conduct two-way analysis of variance without replication, using a randomised block design with blocking.
