20 Analysis of variance

Subject content	Additional information
20.1 Conduct one-way analysis of variance, using a completely randomised design with appreciation of the underlying model with additive effects and experimental errors distributed as $N(0, \sigma^2)$.	Students will only be required to use one-factor ANOVA or two-factor ANOVA (and will not be required to use a Latin square). (applies to all of section 20)
20.2 Conduct two-way analysis of variance without replication, using a randomised block design with blocking.	
20.3 Identify assumptions and interpretations in context.	ANOVA - assumptions that the distributions from which the samples are taken are normal and have equal variances for the test to be valid.
