3.2.3	**Equilibria**	
	The dynamic nature of equilibria	know that many chemical reactions are reversible
		understand that for a reaction in equilibrium, although the concentrations of reactants and products remain constant, both forward and reverse reactions are still proceeding at equal rates
	Qualitative effects of changes of pressure, temperature and concentration on a system in equilibrium	be able to use Le Chatelier's principle to predict the effects of changes in temperature, pressure and concentration on the position of equilibrium in homogeneous reactions
		know that a catalyst does not affect the position of equilibrium
	Importance of equilibria in industrial processes	be able to apply these concepts to given chemical processes
		be able to predict qualitatively the effect of temperature on the position of equilibrium from the sign of ΔH for the forward reaction
		understand why a compromise temperature and pressure may be used
		know about the hydration of ethene to form ethanol and the reaction of carbon monoxide with hydrogen to form methanol as important industrial examples where these principles can be applied
		know the importance of these alcohols as liquid fuels
