1.9 Tectonic hazard impacts can be managed by a variety of mitigation and adaptation strategies, which vary in their effectiveness.	a.	Strategies to modify the event include land-use zoning, hazard – resistant design and engineering defences as well as diversion of lava flows. (***P: role of planners, engineers***) (7)
	b.	Strategies to modify vulnerability and resilience include hi-tech monitoring, prediction, education, community preparedness and adaptation. (**F: models forecasting disaster impacts with and without modification**)
	c.	Strategies to modify loss include emergency, short and longer term aid and insurance (***P: role of NGOs and insurers)*** and the actions of affected communities themselves.

Guidance for integrating geographical skills for Topic 1

The following skills provide suggested opportunities for integrating the full range of skills outlined in the geographical skills appendix (*Appendix 1*). These skills are **not** exclusive to the topic areas under which they appear; students will need to be able to apply these skills across any suitable topic area throughout their course of study.

(1) Analysis of hazard distribution patterns on world and regional scale maps.

(2) Use of block diagrams to identify key features of different plate boundary settings.

(3) Analysis of tsunami time-travel maps to aid prediction.

(4) Use of correlation techniques to analyse links between magnitude of events, deaths and damage.

(5) Statistical analysis of contrasting events of similar magnitude to compare deaths and damage.

(6) Interrogation of large data sets to assess data reliability and to identify and interpret complex trends.

(7) Use of Geographic Information Systems (GIS) to identify hazard risk zones and degree of risk related to physical and human geographical features.
