8. **Integration**		
8.1	Evaluation of definite integrals.	
8.2	Interpretation of the definite integral as the area under a curve.	Students will be expected to be able to evaluate the area of a region bounded by a curve and given straight lines. For example, find the finite area bounded by the curve $y = 6x - x^2$ and the line $y = 2x$. $\int x \, dy$ will not be required. Students will be expected to be able to evaluate the area of a region bounded by two curves.
8.3	Approximation of area under a curve using the trapezium rule.	For example, use the trapezium rule to approximate $\int_0^1 \sqrt{(2x+1)} \, dx$ using four strips. Use of increasing number of trapezia to improve accuracy and an estimate of the error may be required.
