| Be familiar with the concept of a number base, in particular: <ul style="list-style-type: none"><li>• decimal (base 10)</li><li>• binary (base 2)</li><li>• hexadecimal (base 16).</li></ul> | Students should be familiar with expressing a number's base using a subscript as follows:<br>Base 10: Number <sub>10</sub> , eg 67 <sub>10</sub><br>Base 2: Number <sub>2</sub> , eg 10011011 <sub>2</sub><br>Base 16: Number <sub>16</sub> , eg AE <sub>16</sub> |
| Convert between decimal, binary and hexadecimal number bases.                                                                                                                                |                                                                                                                                                                                                                                                                   |
| Be familiar with, and able to use, hexadecimal as a shorthand for binary and to understand why it is used in this way.                                                                       |                                                                                                                                                                                                                                                                   |
