

3.2.1	Energetics	
	Enthalpy change (ΔH)	know that reactions can be endothermic or exothermic
		understand that enthalpy change (ΔH) is the heat energy change measured under conditions of constant pressure
		know that standard enthalpy changes refer to standard conditions, i.e. 100 kPa and a stated temperature (e.g. ΔH_{298})
		be able to recall the definition of standard enthalpies of combustion ($\Delta H_c^\ominus$) and formation ($\Delta H_f^\ominus$)
	Calorimetry	be able to calculate the enthalpy change from the heat change in a reaction using the equation $q = mc \Delta T$
	Simple applications of Hess's Law	know Hess's Law and be able to use it to perform simple calculations, for example calculating enthalpy changes for reactions from enthalpies of combustion or enthalpies of formation
	Bond enthalpies	be able to determine mean bond enthalpies from given data
		be able to use mean bond enthalpies to calculate a value of ΔH for simple reactions
