

3.4.6	Aromatic Chemistry	
	<i>Bonding</i>	understand the nature of the bonding in a benzene ring, limited to planar structure and bond length intermediate between single and double
	<i>Delocalisation stability</i>	understand that delocalisation confers stability to the molecule
		be able to use thermochemical evidence from enthalpies of hydrogenation to illustrate this principle
	<i>Electrophilic substitution</i>	understand that electrophilic attack in arenes results in substitution; mechanisms limited to the monosubstitutions given below
	<i>Nitration</i>	understand that nitration is an important step in synthesis e.g. manufacture of explosives and formation of amines from which dyestuffs are manufactured
		understand the mechanism of nitration, including the generation of the nitronium ion
	<i>Friedel–Crafts acylation reactions</i>	understand that Friedel–Crafts acylation reactions are important steps in synthesis
		understand the mechanism of acylation using AlCl_3 as catalyst
