

3.4.7	Amines	
	Base properties (Brønsted–Lowry)	be able to explain the difference in base strength between ammonia, primary aliphatic and primary aromatic amines in terms of the availability of a lone pair on the N atom
	Nucleophilic properties	understand that the nucleophilic substitution reactions (including mechanism) of ammonia and amines with haloalkanes form primary, secondary, tertiary amines and quaternary ammonium salts; know that the latter can be used as cationic surfactants
	Preparation	know that primary aliphatic amines can be prepared from haloalkanes and by the reduction of nitriles
		know that aromatic amines are prepared by the reduction of nitro compounds
