

3.4.9	Polymers	
	Addition polymers	be able to draw the repeating unit of addition polymers from monomer structures and vice versa
	Condensation polymers	understand that condensation polymers may be formed by reactions between dicarboxylic acids and diols, between dicarboxylic acids and diamines and between amino acids
		know the linkage of the repeating units of polyesters (e.g. Terylene) and polyamides (e.g. nylon 6,6 and Kevlar)
	Biodegradability and disposal of polymers	understand that polyalkenes are chemically inert and therefore non-biodegradable
		understand that polyesters and polyamides can be broken down by hydrolysis and are, therefore, biodegradable (mechanisms not required)
		appreciate the advantages and disadvantages of different methods of disposal of polymers
		appreciate the advantages and disadvantages of recycling polymers
