

4.3.5 Sorting algorithms

4.3.5.1 Bubble sort

Content	Additional information
Know and be able to trace and analyse the time complexity of the bubble sort algorithm.	This is included as an example of a particularly inefficient sorting algorithm, time-wise. Time complexity is $O(n^2)$.

4.3.5.2 Merge sort

Content	Additional information
Be able to trace and analyse the time complexity of the merge sort algorithm.	The 'merge' sort is an example of 'Divide and Conquer' approach to problem solving. Time complexity is $O(n \log n)$.
