

3.2.4 Design processes

Content	Potential links to maths and science
The stages of a range of design processes in order to apply personal judgement and relevant criteria in the appraisal of products and systems, including: • investigations and analysis • use of inspiration materials, eg mood boards • ideas generation • illustration • modelling • planning • evaluating and testing.

Prototype development. Students should be aware of, and able to discuss and demonstrate, the development of a prototype from design proposals. This knowledge should influence the development of design ideas for the NEA so that students may make high quality products the meet the needs of identified users. Students should have knowledge and experience of: • basic pattern/template drafting, knowledge and use of technical terms, including: • basic block • labelling • notching • balance marks • seam allowance • be able to work from a set of basic block patterns, developed from individual measurements or from commercial basic block, including: • bodice front and back • sleeve, skirt and trouser front and back • basic adaptations to create unique and individual styles: • manipulation of the basic templates to develop patterns as required • moving of darts and seams to create new fullness • shaping or creating yokes • use of toiles: how toiles are used to test and develop fashion and clothing products and pattern templates.	The use of mathematics in developing pattern templates
The iterative design process in industrial or commercial contexts. How different design methodologies are used by designers in the corporate world when designing products including collaborative working and the cyclic nature of commercial design and manufacture.
