

3.4.3 Sound designer

Students who have chosen sound design as a specialism are expected to:

- learn how to create and realise sound designs that contribute positively to the overall effect of the performance and are fully aligned with the dramatic aims of the group
- develop interpretative skills, creativity and inventiveness
- develop the ability to create and enhance meaning for an audience
- develop the ability to establish location/time and/or to enhance mood/atmosphere through sound design
- develop the ability to make appropriate selection of equipment, for example, choice of microphones, amplifiers or software; musical instruments, conventional and/or improvised
- develop the ability to make appropriate recordings and/or selections of sound/music
- develop the ability to ensure sound levels, reverb, echo, recorded sound effects, fades, soundscapes or music are manipulated effectively
- adopt the latest safe working practices.

It is the student's sound **design** that is assessed. Although students are expected to operate the sound equipment when possible, this will not form part of the assessment.
