

4.3.4 Using concentrations of solutions in mol/dm³ (chemistry only) (HT only)

Content	Key opportunities for skills development
The concentration of a solution can be measured in mol/dm³. The amount in moles of solute or the mass in grams of solute in a given volume of solution can be calculated from its concentration in mol/dm³. If the volumes of two solutions that react completely are known and the concentration of one solution is known, the concentration of the other solution can be calculated. Students should be able to explain how the concentration of a solution in mol/dm³ is related to the mass of the solute and the volume of the solution.	WS 4.2, 4.3, 4.6 MS 1a Recognise and use expressions in decimal form. MS 1c Use ratios, fractions and percentages. MS 3b Change the subject of an equation. MS 3c Substitute numerical values into algebraic equations using appropriate units for physical quantities. AT 1, 3, 8 Opportunities within titrations including to determine concentrations of strong acids and alkalis.
