

3.3.7 Representing sound

Content	Additional information
Understand that sound is analogue and that it must be converted to a digital form for storage and processing in a computer.	
Understand that analogue signals are sampled to create the digital version of sound.	Students should understand that a sample is a measure of amplitude at a point in time.
Describe the digital representation of sound in terms of: • sampling rate • sample resolution.	Sampling rate is the number of samples taken in a second and is usually measured in hertz (1 hertz = 1 sample per second). Sample resolution is the number of bits per sample.
Calculate sound file sizes based on the sampling rate and the sample resolution.	File size (bits) = rate x res x secs rate = sampling rate res = sample resolution secs = number of seconds
