

9.5 Nervous transmission

- i Understand how the properties of the axon membrane and the transport of Na^+ ions and K^+ ions result in a resting potential.
- ii Understand how an action potential is formed and how it is propagated along an axon.
- iii Understand why the speed of transmission along myelinated axons is greater than along non-myelinated axons, including the role of saltatory conduction.
- iv Understand the structure and function of a synapse, including the role of transmitter substances limited to acetylcholine and noradrenaline.
- v Understand the formation and effects of excitatory and inhibitory postsynaptic potentials.
