

-
- d interpret given information about solvents and solubility to explain the choice of solvents in given contexts, discussing the factors that determine the solubility including:
 - i the solubility of ionic compounds in water in terms of the hydration of the ions
 - ii the water solubility of simple alcohols in terms of hydrogen bonding
 - iii the insolubility of compounds that cannot form hydrogen bonds with water molecules, eg polar molecules such as halogenoalkanes
 - iv the solubility in non-aqueous solvents of compounds which have similar intermolecular forces to those in the solvent.

2.6 Redox

Students will be assessed on their ability to:

- a demonstrate an understanding of:
 - i oxidation number — the rules for assigning oxidation numbers
 - ii oxidation and reduction as electron transfer
 - iii oxidation and reduction in terms of oxidation number changes
 - iv how oxidation number is a useful concept in terms of the classification of reactions as redox and as disproportionation
- b write ionic half-equations and use them to construct full ionic equations.
