

1.8 Theoretical frameworks can be used to understand the predication, impact and management of tectonic hazards.	a. Prediction and forecasting (<i>P: role of scientists</i>) accuracy depend on the type and location of the tectonic hazard.
	b. The importance of different stages in the hazard management cycle (response, recovery, mitigation, preparedness). (<i>P: role of emergency planners</i>)
	c. Use of Park's Model to compare the response curve of hazard events, comparing areas at different stages of development.
