

5.4 Deficits within the hydrological cycle result from physical processes but can have significant impacts.	a. The courses of drought, both meteorological and hydrological: short-term precipitation deficit, longer term trends, and ENSO cycles. (5) (6)
	b. The contribution human activity makes to the risk of drought: over-abstraction of surface water resources and ground water aquifers (🌐 Sahelian or Australia drought).
	c. The impacts of drought on ecosystem functioning (wetlands, forest stress) and the resilience of these ecosystems.
