

3.7 Memory models	3.7.1 Information processing Components of information processing, including: input, stimulus identification, perception and selective attention, response selection, response programming, output – based on the models of Welford and Whiting. Detection, comparison and recognition (DCR) phases.
	3.7.2 The three memory systems as short-term sensory store (STSS), short-term memory (STM) and long-term memory (LTM).
	3.7.3 STM and STSS: capacity, duration, encoding, chunking, selective attention.
	3.7.4 LTM: capacity, duration, encoding, recall, multi-store memory.
	3.7.5 Link between STSS, STM and LTM in terms of retrieval and rehearsal and how this affects output.
	3.7.6 Measuring reaction and response times using appropriate technology. Hick's Law, simple/choice reaction time. Plotting, interpreting and analysing data generated from reaction and response times. Psychological refractory period. Implications to a coach and performer in optimising performance.
	3.7.7 Understanding that schema theory is an organised package of information stored in LTM that updates and modifies motor programmes. Recall schema as in information about producing the movement. Recognition schema as in judging the movement. Schemas based on knowledge of the initial conditions, response specifications, sensory consequences and movement outcomes. Implications of schema theory to a coach and performer in optimising performance.
