

Topic 10: Space

Mathematical skills that could be developed in this topic include using approximations and sketching relationships which are modelled by $y = k/x^2$.

This topic may be studied using contexts such as the formation and evolution of stars and the history and future of the universe.

Students should:

- | |
|--|
| 156. be able to use the equation, intensity $I = \frac{L}{4\pi d^2}$ where L is luminosity and d is distance from the source |
| 157. understand how astronomical distances can be determined using trigonometric parallax |
| 158. understand how astronomical distances can be determined using measurements of intensity received from standard candles (objects of known luminosity) |
| 159. be able to sketch and interpret a simple Hertzsprung-Russell diagram that relates stellar luminosity to surface temperature |
| 160. understand how to relate the Hertzsprung-Russell diagram to the life cycle of stars |
| 161. understand how the movement of a source of waves relative to an observer/detector gives rise to a shift in frequency (Doppler effect) |
| 162. be able to use the equations for redshift $z = \frac{\Delta\lambda}{\lambda} \approx \frac{\Delta f}{f} \approx \frac{v}{c}$ for a source of electromagnetic radiation moving relative to an observer and $v = H_0 d$ for objects at cosmological distances |
| 163. understand the controversy over the age and ultimate fate of the universe associated with the value of the Hubble constant and the possible existence of dark matter. |
