

3.2 Methods	3.2.1 Correlational research • The use of the correlational research method in psychology, including co-variables. • Types of correlation: positive, negative and including the use of scatter diagrams. • Issues surrounding the use of correlations in psychology; issues with cause and effect, other variables.
	3.2.2 Analysis of correlational data • Analysis of, use of, and drawing conclusions from correlational studies, including scatter diagrams, using inferential statistical testing (use of Spearman's rho) and issues of statistical significance; levels of measurement; critical and observed values. • The use of alternate, experimental and null hypotheses. The use of IV and DV in experiments and co-variables in correlations. The use of control groups, randomising to groups, sampling, levels of measurement (ordinal, interval, nominal), reasons for using Spearman's rho.
	3.2.3 Other biological research methods • Brain-scanning techniques (CAT, PET, and fMRI). • The use of brain-scanning techniques to investigate human behaviour, e.g. aggression. • One twin study and one adoption study, e.g. Gottesman and Shields (1966); Ludeke et al. (2013).
