

## Topic 2 – Motion and forces

| Students should:                                                                                                                                                                                                                                                                                                             | Maths skills                       |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|
| 2.1 Explain that a scalar quantity has magnitude (size) but no specific direction                                                                                                                                                                                                                                            |                                    |
| 2.2 Explain that a vector quantity has both magnitude (size) and a specific direction                                                                                                                                                                                                                                        | 5b                                 |
| 2.3 Explain the difference between vector and scalar quantities                                                                                                                                                                                                                                                              | 5b                                 |
| 2.4 Recall vector and scalar quantities, including:<br>a displacement/distance<br>b velocity/speed<br>c acceleration<br>d force<br>e weight/mass<br>f momentum<br>g energy                                                                                                                                                   |                                    |
| 2.5 Recall that velocity is speed in a stated direction                                                                                                                                                                                                                                                                      | 5b                                 |
| 2.6 Recall and use the equations:<br>a (average) speed (metre per second, m/s) = distance (metre, m) ÷ time (s)<br>b distance travelled (metre, m) = average speed (metre per second, m/s) × time (s)                                                                                                                        | 1a, 1c, 1d<br>2a<br>3a, 3c, 3d     |
| 2.7 Analyse distance/time graphs including determination of speed from the gradient                                                                                                                                                                                                                                          | 2a<br>4a, 4b, 4d, 4e               |
| 2.8 Recall and use the equation:<br>acceleration (metre per second squared, m/s <sup>2</sup> ) = change in velocity (metre per second, m/s) ÷ time taken (second, s)<br>$a = \frac{(v - u)}{t}$                                                                                                                              | 1a, 1c, 1d<br>2a<br>3a, 3b, 3c, 3d |
| 2.9 Use the equation:<br>(final velocity) <sup>2</sup> ((metre/second) <sup>2</sup> , (m/s) <sup>2</sup> ) – (initial velocity) <sup>2</sup> ((metre/second) <sup>2</sup> , (m/s) <sup>2</sup> ) = 2 × acceleration (metre per second squared, m/s <sup>2</sup> ) × distance (metre, m)<br>$v^2 - u^2 = 2 \times a \times x$ | 1a, 1c, 1d<br>2a<br>3a, 3c, 3d     |

| Students should:                                                                                                                                                                                                                                                                                                                                                        | Maths skills                                                 |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------|
| 2.10 Analyse velocity/time graphs to: <ul style="list-style-type: none"> <li>a compare acceleration from gradients qualitatively</li> <li>b calculate the acceleration from the gradient (for uniform acceleration only)</li> <li>c determine the distance travelled using the area between the graph line and the time axis (for uniform acceleration only)</li> </ul> | 1a, 1c, 1d<br>2a<br>4a, 4b, 4c, 4d,<br>4e, 4f<br>5c          |
| 2.11 Describe a range of laboratory methods for determining the speeds of objects such as the use of light gates                                                                                                                                                                                                                                                        | 1a, 1d<br>2a, 2b, 2c, 2f,<br>2h<br>3a, 3c, 3d<br>4a, 4c      |
| 2.12 Recall some typical speeds encountered in everyday experience for wind and sound, and for walking, running, cycling and other transportation systems                                                                                                                                                                                                               |                                                              |
| 2.13 Recall that the acceleration, $g$ , in free fall is $10 \text{ m/s}^2$ and be able to estimate the magnitudes of everyday accelerations                                                                                                                                                                                                                            | 1d<br>2h                                                     |
| 2.14 Recall Newton's first law and use it in the following situations: <ul style="list-style-type: none"> <li>a where the resultant force on a body is zero, i.e. the body is moving at a constant velocity or is at rest</li> <li>b where the resultant force is not zero, i.e. the speed and/or direction of the body change(s)</li> </ul>                            | 1a, 1d<br>2a<br>3a, 3c, 3d                                   |
| 2.15 Recall and use Newton's second law as:<br>force (newton, N) = mass (kilogram, kg) $\times$ acceleration (metre per second squared, $\text{m/s}^2$ )<br>$F = m \times a$                                                                                                                                                                                            | 1a, 1c, 1d<br>2a<br>3a, 3b, 3c, 3d                           |
| 2.16 Define weight, recall and use the equation:<br>weight (newton, N) = mass (kilogram, kg) $\times$ gravitational field strength (newton per kilogram, N/kg)<br>$W = m \times g$                                                                                                                                                                                      | 1a, 1c, 1d<br>2a<br>3a, 3b, 3c, 3d                           |
| 2.17 Describe how weight is measured                                                                                                                                                                                                                                                                                                                                    |                                                              |
| 2.18 Describe the relationship between the weight of a body and the gravitational field strength                                                                                                                                                                                                                                                                        | 1c                                                           |
| 2.19 <i>Core Practical: Investigate the relationship between force, mass and acceleration by varying the masses added to trolleys</i>                                                                                                                                                                                                                                   | 1a, 1c, 1d<br>2a, 2b, 2f<br>3a, 3b, 3c, 3d<br>4a, 4b, 4c, 4d |

| Students should:                                                                                                                                                                                                                                                                                                                 | Maths skills                       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|
| 2.20 <b>Explain that an object moving in a circular orbit at constant speed has a changing velocity (qualitative only)</b>                                                                                                                                                                                                       | 5b                                 |
| 2.21 <b>Explain that for motion in a circle there must be a resultant force known as a centripetal force that acts towards the centre of the circle</b>                                                                                                                                                                          | 5b                                 |
| 2.22 <b>Explain that inertial mass is a measure of how difficult it is to change the velocity of an object (including from rest) and know that it is defined as the ratio of force over acceleration</b>                                                                                                                         | 1c,                                |
| 2.23 Recall and apply Newton's third law <b>both</b> to equilibrium situations <b>and to collision interactions and relate it to the conservation of momentum in collisions</b>                                                                                                                                                  | 1a, 1c, 1d<br>2a<br>3a, 3b, 3c, 3d |
| 2.24 <b>Define momentum, recall and use the equation:</b><br><b>momentum (kilogram metre per second, kg m/s) = mass (kilogram, kg) × velocity (metre per second, m/s)</b><br>$p = m \times v$                                                                                                                                    | 1a, 1c, 1d<br>2a<br>3a, 3b, 3c, 3d |
| 2.25 <b>Describe examples of momentum in collisions</b>                                                                                                                                                                                                                                                                          | 1a, 1c, 1d<br>2a<br>3a, 3b, 3c, 3d |
| 2.26 <b>Use Newton's second law as:</b><br><b>force (newton, N) = change in momentum (kilogram metre per second, kg m/s) ÷ time (second, s)</b><br>$F = \frac{(mv - mu)}{t}$                                                                                                                                                     | 1a, 1c, 1d<br>2a<br>3a, 3b, 3c, 3d |
| 2.27 Explain methods of measuring human reaction times and recall typical results                                                                                                                                                                                                                                                | 2a, 2b, 2c, 2g                     |
| 2.28 Recall that the stopping distance of a vehicle is made up of the sum of the thinking distance and the braking distance                                                                                                                                                                                                      | 1a                                 |
| 2.29 Explain that the stopping distance of a vehicle is affected by a range of factors including:<br>a the mass of the vehicle<br>b the speed of the vehicle<br>c the driver's reaction time<br>d the state of the vehicle's brakes<br>e the state of the road<br>f the amount of friction between the tyre and the road surface | 1c, 1d<br>2b, 2c, 2h<br>3b, 3c     |

| Students should:                                                                                                                                                                                        | Maths skills                       |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|
| 2.30 Describe the factors affecting a driver's reaction time including drugs and distractions                                                                                                           | 1d<br>2b, 2h<br>3c                 |
| 2.31 Explain the dangers caused by large decelerations <b>and estimate the forces involved in typical situations on a public road</b>                                                                   | 1c, 1d,<br>2c, 2h,<br>3b, 3c       |
| 2.32P Estimate how the distance required for a road vehicle to stop in an emergency varies over a range of typical speeds                                                                               | 1a, 1c, 1d<br>2a<br>3a, 3b, 3c, 3d |
| 2.33P Carry out calculations on work done to show the dependence of braking distance for a vehicle on initial velocity squared (work done to bring a vehicle to rest equals its initial kinetic energy) | 1c, 1d<br>2b, 2h<br>3b, 3c         |

### Use of mathematics

- Make calculations using ratios and proportional reasoning to convert units and to compute rates (1c, 3c).
- Relate changes and differences in motion to appropriate distance-time, and velocity-time graphs, and interpret lines and slopes (4a, 4b, 4c, 4d).
- **Interpret enclosed areas in velocity-time graphs (4a, 4b, 4c, 4d, 4f).**
- Apply formulae relating distance, time and speed, for uniform motion, and for motion with uniform acceleration, and calculate average speed for non-uniform motion (1a, 1c, 3c).
- Estimate how the distances required for road vehicles to stop in an emergency, varies over a range of typical speeds (1c, 1d, 2c, 2h, 3b, 3c).
- Apply formulae relating force, mass and relevant physical constants, including gravitational field strength, to explore how changes in these are inter-related (1c, 3b, 3c).
- Apply formulae relating force, mass, velocity and acceleration to explain how the changes involved are inter-related (3b, 3c, 3d).
- Estimate, for everyday road transport, the speed, accelerations and forces involved in large accelerations (1d, 2b, 2h, 3c).

### Suggested practicals

- Investigate the acceleration,  $g$ , in free fall and the magnitudes of everyday accelerations.
- Investigate conservation of momentum during collisions.
- Investigate inelastic collisions with the two objects remaining together after the collision and also 'near' elastic collisions.
- Investigate the relationship between mass and weight.
- Investigate how crumple zones can be used to reduce the forces in collisions.
