

(b) Measures of central tendency		
2b.01	Calculate averages for discrete and grouped data: mode, median, arithmetic mean. The term 'mean' should be understood to be 'arithmetic mean'.	Calculations of mean and median for grouped data will include equal class widths. Linear interpolation for median is expected. Use of class midpoints (mid-interval values) to find an estimate of the mean of grouped data is expected. Understand the effect on the mean, mode and median of changes in the data, including the addition or withdrawal of a population or sample member. Understand the effect of transformations of the data on the mean, mode and median. (Transformations will be restricted to simple scaling and translations.)
2b.02	<u>Justify the rationale for selecting appropriate types of average in context.</u>	<u>e.g. mode is appropriate when considering demand for items of clothing in different sizes, or when data is non-numeric;</u> <u>e.g. median is more appropriate than mean if data is skewed; etc</u> <u>e.g. mean is appropriate to take account of all data</u>
2b.03	Compare different data sets using appropriate calculated or given measure of central tendency: mode, modal class, median and mean.	An awareness of which measure is more appropriate to use is expected, e.g. selecting the appropriate values from those produced by statistical software.
