

(c) Measures of central tendency

Students should be taught to:

work out and use the mean, mode and median of raw data presented as a list;

work out the mean, mode and median for discrete data presented as a frequency distribution;

identify the modal class interval for grouped frequency distributions for discrete or continuous data;

work out and use estimates for the mean and median of grouped frequency distributions for discrete or continuous data;

understand the appropriateness, advantages and disadvantages of each of the three measures of central tendency;

be able to make a reasoned choice of a measure of central tendency appropriate to a particular line of enquiry.

No more than 30 numbers in the list will be examined.

Graphical and other methods for the median will be expected. Σ notation will be expected.

Frequency distributions with equal class intervals only.

Graphical and other methods for the median will be expected.

Explaining why certain measures are inappropriate will be expected.
