

5.2 Transformation geometry	understand that rotations are specified by a centre and an angle rotate a shape about a point through a given angle recognise that an anti-clockwise rotation is a <i>positive</i> angle of rotation and a clockwise rotation is a <i>negative</i> angle of rotation understand that reflections are specified by a mirror line construct a mirror line given an object reflect a shape given a mirror line understand that translations are specified by a distance and direction translate a shape understand that rotations, reflections and translations preserve length and angle so that a transformed shape under any of these transformations remains congruent to the original shape understand that enlargements are specified by a centre and a scale factor understand that enlargements preserve angles and not lengths enlarge a shape given the scale factor identify and give complete descriptions of transformations	Such as $x = 1, y = 2$, $y = x, y - x = 0$ Reflect a triangle in the line $y = x$ Given, for example, 5 units in the x direction, and 3 units in the y direction (not angle and distance) Positive scale factor only (including fractions) With or without a centre given
