

2.9 Chemical equilibria

Students will be assessed on their ability to:

- a demonstrate an understanding that chemical equilibria are dynamic
- b deduce the qualitative effects of changes of temperature, pressure and concentration on the position of equilibrium, e.g. extraction of methane from methane hydrate
- c interpret the results of simple experiments to demonstrate the effect of a change of temperature, pressure and concentration on a system at equilibrium, e.g.
 - i iodine(I) chloride reacting with chlorine to form iodine(III) chloride, or
 - ii $\text{N}_2\text{O}_4 \rightleftharpoons 2\text{NO}_2$.
