

3. Exponential and logarithms		
3.1	The function e^x and its graph.	To include the graph of $y = e^{ax+b} + c$
3.2	The function $\ln x$ and its graph; $\ln x$ as the inverse function of e^x .	Solution of equations of the form $e^{ax+b} = p$ and $\ln(ax+b) = q$ is expected.
3.3	Use logarithmic graphs to estimate parameters in relationships of the form $y = ax^n$ and $y = kb^x$.	Plot $\log y$ against $\log x$ and obtain a straight line where the intercept is $\log a$ and the gradient is n. Plot $\log y$ against x and obtain a straight line where the intercept is $\log k$ and the gradient is $\log b$.
