

Topic 23: Chemical reactions – Formulae and equations

Students should:		Guidance <i>iLowerSecondary Curriculum reference</i>
23.1	understand how to represent simple chemical reactions using formulae and equations, including state symbols	reactions should include: • elements reacting with oxygen, for example magnesium, copper and carbon • metals reacting with dilute hydrochloric acid, for example magnesium and zinc • the thermal decomposition of metal carbonates, for example copper carbonate. understand the terms <i>reactants</i> and <i>products</i> (This builds on <i>Year 7: Chemical reactions – Chemical reactions introduction</i>) <i>Year 9: Chemical reactions – Formulae and equations</i>
23.2	understand the conservation of mass in chemical reactions	understand why some reactions appear to lose or gain mass, for example when a gas is produced <i>Year 9: Chemical reactions – Formulae and equations</i>
