

Topic 37: Waves – Sound detection

Students should:		Guidance <i>iLowerSecondary Curriculum reference</i>
37.1	know how animals use ears to detect sound	know that the outer ear collects and directs sound waves on to the ear drum causing the ear drum to vibrate; the inner ear converts vibrations into electrical signals (details of the inner ear NOT required); the brain interprets the electrical signals as sound know that some animals have muscles that enable them to point their outer ear in different directions (better predator detection) <i>Year 7: Waves – Sound detection</i>
37.2	know that sound waves transfer energy	know ways in which sound is used, for example communication, ultrasound, and sonar <i>Year 7: Waves – Sound detection</i>
