

1.4 Data types, data structures and algorithms

How data is represented and stored within different structures. Different algorithms that can be applied to these structures

1.4.1 Data Types

- (a) Primitive data types, integer, real/floating point, character, string and Boolean.
- (b) Represent positive integers in binary.
- (c) Use of sign and magnitude and two's complement to represent negative numbers in binary.
- (d) Addition and subtraction of binary integers.
- (e) Represent positive integers in hexadecimal.
- (f) Convert positive integers between binary hexadecimal and denary.
- (g) Representation and normalisation of floating point numbers in binary.
- (h) Floating point arithmetic, positive and negative numbers, addition and subtraction.
- (i) Bitwise manipulation and masks: shifts, combining with AND, OR, and XOR.
- (j) How character sets (ASCII and UNICODE) are used to represent text.

1.4.2 Data Structures

- (a) Arrays (of up to 3 dimensions), records, lists, tuples.
- (b) The following structures to store data: linked-list, graph (directed and undirected), stack, queue, tree, binary search tree, hash table.
- (c) How to create, traverse, add data to and remove data from the data structures mentioned above. *(NB this can be **either** using arrays and procedural programming **or** an object-oriented approach).*

1.4.3 Boolean Algebra

- (a) Define problems using Boolean logic. See appendix 5d.
- (b) Manipulate Boolean expressions, including the use of Karnaugh maps to simplify Boolean expressions.
- (c) Use the following rules to derive or simplify statements in Boolean algebra: De Morgan's Laws, distribution, association, commutation, double negation.
- (d) Using logic gate diagrams and truth tables. See appendix 5d.
- (e) The logic associated with D type flip flops, half and full adders.
