

1.08 Integration				
1.08a	Fundamental theorem of calculus	a) Know and be able to use the fundamental theorem of calculus. <i>i.e. Learners should know that integration may be defined as the reverse of differentiation and be able to apply the result that $\int f(x)dx = F(x) + c \Leftrightarrow f(x) = \frac{d}{dx}(F(x))$, for sufficiently well-behaved functions.</i> <i>Includes understanding and being able to use the terms indefinite and definite when applied to integrals.</i>		MH1
1.08b 1.08c	Indefinite integrals	b) Be able to integrate x^n where $n \neq -1$ and related sums, differences and constant multiples. <i>Learners should also be able to solve problems involving the evaluation of a constant of integration e.g. to find the equation of the curve through $(-1, 2)$ for which $\frac{dy}{dx} = 2x + 1$.</i>	c) Be able to integrate e^{kx}, $\frac{1}{x}$, $\sin kx$, $\cos kx$ and related sums, differences and constant multiples. <i>[Integrals of arcsin, arccos and arctan will be given if required.]</i> <i>This includes using trigonometric relations such as double-angle formulae to facilitate the integration of functions such as $\cos^2 x$.</i>	MH2
1.08d 1.08e 1.08f	Definite integrals and areas	d) Be able to evaluate definite integrals. e) Be able to use a definite integral to find the area between a curve and the x-axis. <i>This area is defined to be that enclosed by a curve, the x-axis and two ordinates. Areas may be included which are partly below and partly above the x-axis, or entirely below the x-axis.</i>	f) Be able to use a definite integral to find the area between two curves. <i>This may include using integration to find the area of a region bounded by a curve and lines parallel to the coordinate axes, or between two curves or between a line and a curve.</i> <i>This includes curves defined parametrically.</i>	MH3

1.08g	Integration as the limit of a sum		g) Understand and be able to use integration as the limit of a sum. <i>In particular, they should know that the area under a graph can be found as the limit of a sum of areas of rectangles.</i> <i>See also 1.09f.</i>	MH4
1.08h	Integration by substitution		h) Be able to carry out simple cases of integration by substitution. <i>Learners should understand the relationship between this method and the chain rule.</i> <i>Learners will be expected to integrate examples in the form $f'(x)(f(x))^n$, such as $(2x + 3)^5$ or $x(x^2 + 3)^7$, either by inspection or substitution.</i> <i>Learners will be expected to recognise an integrand of the form $\frac{kf'(x)}{f(x)}$ such as $\frac{x^2 + x}{2x^3 + 3x^2 - 7}$ or $\tan x$.</i> <i>Integration by substitution is limited to cases where one substitution will lead to a function which can be integrated. Substitutions may or may not be given.</i> <i>Learners should be able to find a suitable substitution in integrands such as $\frac{(4x - 1)}{(2x + 1)^5}$, $\sqrt{9 - x^2}$ or $\frac{1}{1 + \sqrt{x}}$.</i>	MH5

1.08i	Integration by parts		i) Be able to carry out simple cases of integration by parts. <i>Learners should understand the relationship between this method and the product rule.</i> <i>Integration by parts may include more than one application of the method e.g. $x^2 \sin x$.</i> <i>Learners will be expected to be able to apply integration by parts to the integral of $\ln x$ and related functions.</i> <i>[Reduction formulae are excluded.]</i>	MH5
1.08j	Use of partial fractions in integration		j) Be able to integrate functions using partial fractions that have linear terms in the denominator. <i>i.e. Functions with denominators no more complicated than the forms $(ax + b)(cx + d)^2$ or $(ax + b)(cx + d)(ex + f)$.</i>	MH6
1.08k	Differential equations with separable variables		k) Be able to evaluate the analytical solution of simple first order differential equations with separable variables, including finding particular solutions. <i>Separation of variables may require factorisation involving a common factor.</i> <i>Includes: finding by integration the general solution of a differential equation involving separating variables or direct integration; using a given initial condition to find a particular solution.</i>	MH7

OCR Ref.	Subject Content	Stage 1 learners should ...	Stage 2 learners additionally should ...	DfE Ref.
1.08I	Interpreting the solution of a differential equation		l) Be able to interpret the solution of a differential equation in the context of solving a problem, including identifying limitations of the solution. <i>Includes links to differential equations connected with kinematics.</i> <i>e.g. If the solution of a differential equation is $v = 20 - 20e^{-t}$, where v is the velocity of a parachutist, describe the motion of the parachutist.</i>	MH8
