

5.1.1 Patterns of inheritance

Learning outcomes	Additional guidance
<i>Learners should be able to demonstrate and apply their knowledge and understanding of:</i>	
(a) patterns of monogenic (monohybrid) inheritance	To include the correct usage of the terms gene, allele (gene variant), locus, phenotype, genotype, dominant and recessive, heterozygous and homozygous and codominant. HSW8
(b) gene mutations	To include cystic fibrosis, sickle cell anaemia, phenylketonuria (PKU) and Huntington's disease.
(c) patterns of inheritance which show codominance and multiple gene variants (alleles)	To include the inheritance of blood groups and HLA antigens in humans.
(d) patterns of inheritance which show sex linkage and autosomal linkage	To include haemophilia (sex linkage) and ABO blood group and nail patella syndrome (autosomal linkage).

- (e) the use of model organisms to investigate patterns of inheritance

To include *Drosophila melanogaster*

AND

patterns of inheritance to include dihybrid inheritance

AND

the use of the chi-squared (χ^2) test to analyse various patterns of inheritance.

M1.4, M1.9

HSW1, HSW2, HSW3, HSW5, HSW6

- (f) chromosome mutations in humans

To include non-disjunction and translocations in the context of Turner's syndrome, Klinefelter's syndrome and Down's syndrome.

- (g) the role of the genetic counsellor and the ethical issues involved in advising families where a genetic disease has been identified.

To include pedigree analysis to predict the probability of genetic disease

AND

the use of genetic testing.

M1.4

HSW2, HSW5, HSW8, HSW9, HSW11, HSW12
