

#### 4.4 From flowers to food

---

Global food security and sustainability are challenges facing the modern world.

Flowering is a critical stage in the life cycle of a plant and so in the production of staple foods, such as rice and wheat. The timing of flowering must coincide

with favourable environmental conditions so that viable seeds can be produced. Learners will consider the different environmental cues which trigger flowering, the adaptations of flowers to different types of pollination and the formation of seeds and their germination.
