

2c. Content of Computer systems (Component 01)

This component will introduce learners to the internal workings of the Central Processing Unit (CPU), the exchanging of data and also looks at software development, data types and legal and ethical issues. It is expected that learners will draw on this underpinning content when studying computational

thinking, developing programming techniques and devising their own programming approach in the Programming project component (03 or 04). Learners will be expected to apply the criteria below in different contexts including current and future uses of the technologies.
