

4.4.2 Certification of Mathematics and Further Mathematics: Order of Aggregation

Units that contribute to an award in Advanced GCE Mathematics may not also be used for an award in Advanced GCE Further Mathematics. Candidates who are awarded certificates in both Advanced GCE Mathematics and Advanced GCE Further Mathematics must use unit results from 12 different teaching modules. Candidates who are awarded certificates in both Advanced GCE Mathematics and Advanced Subsidiary GCE Further Mathematics must use unit results from nine different teaching modules. Candidates who are awarded certificates in both Advanced Subsidiary GCE Mathematics and Advanced Subsidiary GCE Further Mathematics must use unit results from six different teaching modules.

When a candidate has requested awards in both Mathematics and Further Mathematics, OCR will adopt the following procedures which follow the *GCE Mathematics Aggregation Rules*, available on the JCQ website.

If certification for Advanced GCE Mathematics is made **at the same time** as the request for a Further Mathematics certification then the valid combination of units will be chosen that gives, in decreasing order of priority:

- the best possible grade for Mathematics;

- the best possible grade for Further Mathematics;
- the highest possible UMS in Mathematics.

Note: In the aggregation process, in order to achieve the best set of grades for a candidate as described above, it is possible that AS GCE Further Mathematics may include some A2 units.

If the only certifications being requested are Advanced Subsidiary GCE Mathematics **at the same time** as Advanced Subsidiary GCE Further Mathematics then the valid combination of units will be chosen that gives, in decreasing order of priority:

- the best possible grade for AS Mathematics;
- the best possible grade for AS Further Mathematics;
- the highest possible UMS in AS Mathematics.

Candidates are strongly advised to recertificate any previously entered qualifications whenever an entry is made for a qualification. This allows the grades awarded to be optimised according to the JCQ rules. For example, if a candidate sits A level Mathematics the units used towards that qualification are ‘locked’ into Mathematics. If the candidate then enters for AS or A level Further Mathematics in a subsequent series, only the unused units are available for use in Further Mathematics. Recertification of all previously entered qualifications unlocks all units and allows the optimisation of the pair of grades awarded.
