

6.19 DECISION MATHEMATICS COMPUTATION, DC (4773) A2

Objectives

To give students experience of modelling with the aid of suitable software and of the use of algorithms in a variety of situations.

To develop modelling skills with the aid of suitable software.

The problems presented are diverse and require flexibility of approach. Students are expected to consider the success of their modelling, and to appreciate the limitations of their solutions.

Assessment

Examination (72 marks)
2½ hours
Candidates answer four questions.
Each question is worth about 18 marks.

Candidates require access to a computer with a spreadsheet program and a linear programming package, and suitable printing facilities, throughout the examination.

Assumed Knowledge

Candidates are expected to know the content of *C1* and *C2* and *D1*.

Calculators

In the MEI Structured Mathematics specification, no calculator is allowed in the examination for *C1*. For all other units, including this one, a graphical calculator is allowed.

DECISION MATHEMATICS COMPUTATION, DC		
Specification	Ref.	Competence Statements

NETWORK FLOWS

Using networks to model transmission systems.	DCN1	Be able to model a transmission system using a network.
Maximum flow/minimum cut theorem.	2	Be able to specify a cut and to calculate its capacity.
	3	Understand that if an established flow is equal to the capacity of an identified cut, then the flow is maximal and the cut is a minimum cut.
Flow augmentation.	4	Be able to use flow augmentation and the labelling algorithm to establish a maximum flow in simple transmission networks (directed and undirected).
Linear programming formulation.	5	Be able to formulate and solve network flow problems as linear programming problems.

MATCHINGS

Bipartite graphs.	DCM1	Be able to identify when a bipartite graph is an appropriate model.
	2	Be able to construct a bipartite graph.
The matching algorithm.	3	Be able to construct an alternating path and use it to improve a matching.
	4	Be able to model a matching problem as a network flow problem.
Allocation and transportation.	5	Be able to recognise and formulate allocation and transportation problems.
LP formulation.	6	Be able to formulate and solve matching, allocation and transportation problems as linear programming problems.

LINEAR PROGRAMMING

Problem solving.	DCL1	Be able to formulate and solve (using a computer package) a wide variety of problems as linear programming problems.
	2	Be able to interpret the solutions of linear programming problems.

DECISION MATHEMATICS COMPUTATION, DC

NETWORK FLOWS

DCN1	Single and super sources and sinks. Flow in = Flow out for other nodes.	Source: S Sink: T	
2	Describing a cut symbolically.	e.g. SA BCT	
3			
4			Consideration of the complexity of the flow augmentation algorithm.
5			

MATCHINGS

DCM1			
2			
3	Maximal matchings; complete matchings.		
4			
5	To include the use of dummies as required.		The Hungarian and transportation algorithms.
6			

LINEAR PROGRAMMING

DCL1	Problems will not be restricted to maximisation problems with $\leq$ constraints: e.g. blending problems; shortest path problems; stock cutting problems. The variety should be wide, e.g. flows in networks; matchings; allocation problems; transportation problems; set covering; set packing; maximin and minimax problems. (The allocation problem, and other similar problems require integer solutions, but their structure is such that linear programming guarantees an integer solution.) Problems requiring the setting up and use of indicator variables, e.g. modelling 'fixed cost if used' situations. Simple integer problems, e.g. the knapsack problem.		The theory of integer programming.
2

RECURRENCE RELATIONS

Use in problem solving.	DCs1	Be able to model appropriate problems by using recurrence relations.
Solving recurrence relations.	2	Be able to solve first and second order homogeneous and non-homogeneous relations.
	3	Be able to produce, manipulate and interpret spreadsheet models of recurrence relations (including second order oscillatory relations).

SIMULATION

Simulation modelling.	DCZ1	Be able to build and use discrete event/ discrete time simulation models.
	2	Be able to use a spreadsheet function to generate uniformly distributed random numbers (discrete and continuous).
	3	Be able to use spreadsheet functions to transform uniform discrete random variables to non-uniform discrete random variables.
	4	Be able to determine approximately the number of repetitions needed to obtain a required level of accuracy.
	5	Be able to verify and validate a model.
	6	Be able to interpret results.
Computer modelling.	7	Be able to use a spreadsheet package to build, run and interpret simulation models.

RECURRENCE RELATIONS

DCs1

2	Second order homogeneous equations will have constant coefficients. Those to be solved analytically will have real roots. Candidates will be expected to solve equations of the form $a^x = b$.		An extensive knowledge of particular solutions.
---	---	--	---

3

SIMULATION

DCZ1	Hand simulations.		Continuous random variables.
------	-------------------	--	------------------------------

2	Computer simulations using spreadsheets.		
---	--	--	--

3

4	Use of standard error of output variable.		
---	---	--	--

5	Verification: checking that the model functions according to specifications.		
---	--	--	--

6	Validation: checking that a model adequately reflects reality.		
---	--	--	--
