

2.2 Programming techniques

Learners should have studied the following:

- the use of variables, constants, operators, inputs, outputs and assignments
- the use of the three basic programming constructs used to control the flow of a program:
 - sequence
 - selection
 - iteration (count and condition controlled loops)
- the use of basic string manipulation
- the use of basic file handling operations:
 - open
 - read
 - write
 - close
- the use of records to store data
- the use of SQL to search for data
- the use of arrays (or equivalent) when solving problems, including both one and two dimensional arrays
- how to use sub programs (functions and procedures) to produce structured code
- the use of data types:
 - integer
 - real
 - Boolean
 - character and string
 - casting
- the common arithmetic operators
- the common Boolean operators.
