

8.2 Transfer of genetic information

- i Understand the terms 'genotype and phenotype', 'homozygote and heterozygote', 'dominance', 'recessive', 'codominance' and 'multiple alleles'.
- ii Be able to construct genetic crosses and pedigree diagrams.
- iii Understand the inheritance of two non-interacting unlinked genes.
- iv Understand that autosomal linkage results from the presence of alleles on the same chromosome and that the results of crosses can be explained by the events of meiosis, including black/grey body and long/vestigial wing in *Drosophila*.
- v Understand sex linkage on the X chromosome, including haemophilia in humans.
- vi Be able to use chi squared tests to test the significance of the difference between observed and expected results.
