

9.3 Chemical control in plants

- i Understand that chemical control in plants is brought about by plant growth substances such as auxins, cytokinins and gibberellins.

CORE PRACTICAL 14: Investigate the effect of gibberellin on the production of amylase in germinating cereals using a starch agar assay.

- ii Know that auxin has several effects, including cell elongation, suppression of lateral buds (apical dominance) and promoting root growth.
- iii Understand that plant growth substances often interact with each other as shown by the antagonistic actions of cytokinin and auxin on apical dominance.
- iv Understand how phytochrome controls flowering and photomorphogenesis.
