

5.3 The hydrological cycle influences water budgets and river systems at a local scale.	a. Water budgets which show the annual balance between inputs (precipitation) and outputs (evapotranspiration) and their impact on soil, water availability and are influenced by climate type (🌐 tropical temperate or polar examples). (2)
	b. River regimes indicate the annual variation of discharge of a river and result from the impact of climate, geology and soils as shown in regimes from contrasting river basins (🌐 Yukon, Amazon, Indus). (3)
	c. The shape of storm hydrographs depends on physical features of drainage basins (size, shape, drainage density, rock type, soil, relief and vegetation) as well as human factors (land use and urbanisation). (<i>P: the role of planners in managing land use</i>). (4)
