

6.8 There are implications for human wellbeing from the degradation of the water and carbon cycles.	a. Forest loss has implications for human wellbeing but there is some evidence that forest stores are being protected and even expanded in some locations (environmental Kuznets' curve model). (A: attitudes of global consumers to environmental issues)
	b. Increased temperatures affect evaporation rates and the quantity of water vapour in the atmosphere with implications for precipitation patterns, river regimes and water stores (cryosphere and drainage basin stores) (🌐 Arctic) (F: uncertainty of global projections). (7)
	c. Threats to ocean health pose threats to human wellbeing, especially in developing regions that depend on marine resources as a food source and for tourism and coastal protection.
