

3.5 Practical investigation	3.5.1 One practical research exercise to gather data relevant to topics covered in biological psychology. This practical research exercise must adhere to ethical principles in both content and intention.
	In conducting the practical research exercise, students must: • design and conduct a correlational study • link their research to aggression or attitudes to drug use • include inferential statistical testing (Spearman's rho) and explain the significance of the result and the use of levels of significance. Students must also be able to use descriptive statistics (strength/direction) to explain the relationship • produce an abstract of the research method and a discussion section that includes conclusions • include research question/hypothesis; research method, sampling, ethical considerations, data-collection tools, data analysis, results; discussion • consider strengths and weaknesses of the correlational study and possible improvements.
	Suitable examples • A correlation into age and attitudes to drug use. • A correlation to see if there is a relationship between height and a self-rating of aggressive tendencies.
