

1.11 A variety of physical processes interact to shape glaciated upland landscapes	a. Glacial processes that once operated in the glaciated upland landscape: glacial erosion (plucking, abrasion), transport (on or within the ice) and deposition.
	b. Physical processes that operate on the relict upland glacial landscapes of today: mechanical weathering (freeze thaw), mass movement (soil movement, and rock falls/slides).
	c. How past climate and current UK weather and climate (seasonal and diurnal variations in weather) affect processes that impact on glaciated upland landscapes. (14)
