

(a) Tabulation

Students should be taught to:

construct frequency tables by tallying raw data where appropriate;

tabulate using class intervals as appropriate, **including open ended classes and classes of varying width;**

tabulate using various forms of grouping the data;

combine categories to simplify tables with an understanding of the problems of over simplification, the effects on readability, the identification or masking of trends and the loss of detail;

problems associated with under and over simplification through inappropriate number of significant figures or an unsuitable group size;

read and interpret data presented in tabular or graphical form;

The use and interpretation of the standard five point tally will be expected

For continuous or discrete data.

Could include qualitative or quantitative categories.

Students will be expected to comment on aspects such as loss of detail or masking of trends.

An awareness of problems associated with creating categories that are too broad, too narrow or redundant.

Tables of data drawn from media and from government and other statistical sources may be used, eg Social Trends

Content

design suitable tables, including summary tables; design and use appropriate two way tables;

convert raw data to summary statistics, design, construct and present summary tables.

Notes

Systematically listing outcomes from single or two successive events.

The difference between raw data and summary statistics is to be expected.
