

4.2.4 Analytical techniques

Learning outcomes	Additional guidance
<i>Learners should be able to demonstrate and apply their knowledge and understanding of:</i>	
Infrared spectroscopy	
(a) infrared (IR) radiation causes covalent bonds to vibrate more and absorb energy	
(b) absorption of infrared radiation by atmospheric gases containing C=O, O–H and C–H bonds (e.g. CO ₂ , H ₂ O and CH ₄), the suspected link to global warming and resulting changes to energy usage	HSW9,10,11,12 Acceptance of scientific evidence explaining global warming has prompted governments towards policies to use renewable energy supplies.
(c) use of an infrared spectrum of an organic compound to identify:	M3.1
(i) an alcohol from an absorption peak of the O–H bond	In examinations, infrared absorption data will be provided on the <i>Data Sheet</i> . Learners should be aware that most organic compounds produce a peak at approximately 3000 cm ⁻¹ due to absorption by C–H bonds.
(ii) an aldehyde or ketone from an absorption peak of the C=O bond	
(iii) a carboxylic acid from an absorption peak of the C=O bond and a broad absorption peak of the O–H bond	
(d) interpretations and predictions of an infrared spectrum of familiar or unfamiliar substances using supplied data	M3.1 Restricted to functional groups studied in this specification (see also 6.3.2 e). HSW3,5 Analysis and interpretation of spectra.
(e) use of infrared spectroscopy to monitor gases causing air pollution (e.g. CO and NO from car emissions) and in modern breathalysers to measure ethanol in the breath	HSW12 Use of analytical techniques to provide evidence for law courts, e.g. drink driving.
Mass spectrometry	
(f) use of a mass spectrum of an organic compound to identify the molecular ion peak and hence to determine molecular mass	M3.1 Limited to ions with single charges. Learners will not be expected to interpret mass spectra of organic halogen compounds. Limited to organic compounds encountered in this specification (see also 6.3.2 e). Learners should be aware that mass spectra may contain a small M+1 peak from the small proportion of carbon-13. HSW3,5 Analysis and interpretation of spectra.

- (g) analysis of fragmentation peaks in a mass spectrum to identify parts of structures.

M3.1

Learners should be able to suggest the structures of fragment ions.

HSW3,5 Analysis and interpretation of spectra.

Combined techniques

- (h) deduction of the structures of organic compounds from different analytical data including:

M3.1

Limited to functional groups encountered in this specification.

- (i) elemental analysis (**see also 2.1.3c**)
- (ii) mass spectra
- (iii) IR spectra.

Learners will **not** be expected to interpret mass spectra of organic halogen compounds.

HSW3,5,6 Analysis and interpretation of different analytical data.
