

2.05 Statistical Hypothesis Testing

2.05a	The language of hypothesis testing	a) Understand and be able to use the language of statistical hypothesis testing, developed through a binomial model: null hypothesis, alternative hypothesis, significance level, test statistic, 1-tail test, 2-tail test, critical value, critical region, acceptance region, p-value. <i>Hypotheses should be stated in terms of parameter values (where relevant) and the meanings of symbols should be stated. For example,</i> “$H_0: p = 0.7$, $H_1: p \neq 0.7$, where p is the population proportion in favour of the resolution”. <i>Conclusions should be stated in such a way as to reflect the fact that they are not certain. For example,</i> “There is evidence at the 5% level to reject H_0. It is likely that the mean mass is less than 500 g.” “There is no evidence at the 2% level to reject H_0. There is no reason to suppose that the mean journey time has changed.” <i>Some examples of incorrect conclusion are as follows:</i> “H_0 is rejected. Waiting times have increased.” “Accept H_0. Plants in this area have the same height as plants in other areas.”	MO1

2.05b 2.05c	Hypothesis test for the proportion in a binomial distribution	b) Be able to conduct a statistical hypothesis test for the proportion in the binomial distribution and interpret the results in context. c) Understand that a sample is being used to make an inference about the population and appreciate that the significance level is the probability of incorrectly rejecting the null hypothesis. <i>Learners should be able to use a calculator to find critical values.</i> <i>Includes understanding that, where the significance level of a test is specified, the probability of the test statistic being in the rejection region will always be less than or equal to this level.</i> <i>[The use of normal approximation is excluded.]</i>		MO2

2.05d	Hypothesis test for the mean of a normal distribution		d) Recognise that a sample mean, $\bar{X}$, can be regarded as a random variable. <i>Learners should know and be able to use the result that if $X \sim N(\mu, \sigma^2)$ then $\bar{X} \sim N\left(\mu, \frac{\sigma^2}{n}\right)$.</i> <i>[The proof is excluded.]</i>	MO3
2.05e			e) Be able to conduct a statistical hypothesis test for the mean of a normal distribution with known, given or assumed variance and interpret the results in context. <i>Learners should be able to use a calculator to find critical values, but standard tables of the percentage points will be provided in the assessment.</i> <i>[Test for the mean of a non-normal distribution is excluded.]</i> <i>[Estimation of population parameters from a sample is excluded]</i>

2.05f 2.05g	Hypothesis test using Pearson's correlation coefficient		f) Understand Pearson's product-moment correlation coefficient as a measure of how close data points lie to a straight line. g) Use and be able to interpret Pearson's product-moment correlation coefficient in hypothesis tests, using either a given critical value or a p-value and a table of critical values. <i>When using Pearson's coefficient in an hypothesis test, the data may be assumed to come from a bivariate normal distribution.</i> <i>A table of critical values of Pearson's coefficient will be provided.</i> <i>[Calculation of correlation coefficients is excluded.]</i>	MO1
